

Magpi Messaging Kit

Reusable positioning for decks, one-pagers, websites, and company descriptions.

Core positioning

The short version

For small businesses and operations teams that want recurring browser work completed—not another expensive chat to supervise.

Elevator pitch

30 seconds

Magpi is the browser worker for campaigns that take hours or days. Its low-cost worker handles repeated web work while the harness keeps state and routes exceptions. A frontier model periodically reviews the work and coaches the next phase, so Magpi uses expensive intelligence where it changes the quality of the campaign.

60 seconds

Magpi is an open-source desktop worker for browser campaigns that take hours or days. A lower-cost model handles the repeatable browser work. Magpi keeps the campaign state and routes exceptions. A frontier model periodically reviews what the worker produced and coaches the next phase, so the campaign uses expensive reasoning where it can change the quality of the result.

Who it is for

Small-business operators and operations teams who live in browser tabs: e-commerce managers, agencies, sales ops, marketing teams, and back-office owners with recurring web work.

- E-commerce teams that need repeatable price, stock, and listing checks without an employee opening every tab.
- Agencies and sales operations teams that must research accounts, update systems, and prepare follow-up work at a sustainable cost.
- Marketing and back-office teams that gather scattered dashboard data, prepare reports, and need a human to review only the exceptions.

How the harness differs

Magpi keeps the campaign plan and browser state outside the repeated model loop. A lower-cost model performs the harvest work. At checkpoints, a frontier model reviews what the worker produced, identifies drift or uncertainty, and coaches the next phase. Magpi spends frontier-model budget on supervision and correction, rather than on every browser step.

Proof and cost language—use carefully

Why Magpi can run cheaply A lower-cost model handles the repeated browser work. The harness keeps the plan, browser state, and exception handling outside that repeated model loop. That means Magpi reserves frontier-model spend for supervision and correction instead of paying frontier rates for every browser step.	How Magpi protects quality A frontier model periodically reviews what the lower-cost worker produced, identifies drift or uncertainty, and coaches the next phase. The goal is campaign output comparable to frontier-model runs while using far less frontier-model spend. Validate the outcome on the actual workflow and quality bar.
---	---

Customer-facing short text

Magpi is the browser worker for work that outlasts one chat. It runs recurring browser campaigns across the tabs and portals a team already uses, pauses only for human judgment, then keeps going. A lower-cost worker handles the repeated web work while the harness brings in frontier review at checkpoints where coaching changes the quality of the campaign.

Profit-leverage examples

Service business: account research briefs Magpi harvests company facts, role changes, competitor activity, and CRM gaps across a target account list.	5x more account briefs ready for qualification and outreach. One owner reviews 100 account briefs each week rather than researching 20 accounts manually. The business person spends time on the shortlist, relationship context, and personal follow-up rather than browser harvesting.
E-commerce operator: priority SKU monitoring Magpi harvests competitor price, stock, promotion, and listing signals across priority product pages.	10x more priority SKUs under watch. One operator watches 500 product pages each day rather than opening 50 pages by hand. The operator reviews exceptions and responds faster to margin, stock, and listing changes.

Product scope

Free and open-source desktop product for browser campaigns that can run for hours or days. The product pauses for a short, dedicated human moment when a decision, credential, or confirmation is required, then resumes the campaign.
